All of us are part of an old, old family. The roots of our family tree reach back millions of years to the beginning of life on earth. Open this family album and embark on an amazing journey. You'll meet some of our oldest relatives--from both the land and the sea--and discover what we inherited from each of them along the many steps of our wondrous past. Complete with an illustrated timeline and glossary, here is the story of human evolution as it's never been told before.
the seas. We hear about oxygen filling the planet and how the seas rose and fell, changing the landscape. About how animals crawled up onto the land and how after an asteroid our particular branch of the family tree survived. Finally, the monkeys evolved, and we evolved out of the monkeys. The book ends with further details for the inquisitive child about each step of the family tree. A helpful timeline follows these facts at the end. For those human beings that dislike the notion of evolution and prefer a more creation-laden viewpoint, this is not the book for you. It’s pretty darn clear in the text that life began 3,800 to 3,600 million years ago. End of story.
