Compiler Construction (International Computer Science Series)

Synopsis

A refreshing antidote to heavy theoretical tomes, this book is a concise, practical guide to modern compiler design and construction by an acknowledged master. Readers are taken step-by-step through each stage of compiler design, using the simple yet powerful method of recursive descent to create a compiler for Oberon-0, a subset of the author's Oberon language. The hands-on, pragmatic approach makes the book equally attractive for project-oriented courses in compiler design and for software engineers wishing to develop their skills in system software. A disk provided with the book gives full listings of the Oberon-0 compiler and associated tools. There is a bug in the installation of this disk, to correct please do the following: *Open the file install.inf in a text editor (e.g. Notepad), this file is found in the win_sys directory. *Scroll down until you find a section marked (files), this is the second last section and is very close to the bottom of the file. *Find the line readme.wri = \$I, 9000,0,Information on Oberon, 0,0 and change it so that it reads readme.txt = \$I, 9000,0,Information on Oberon, 0,0

Book Information

Series: International Computer Science Series

Paperback: 176 pages

Publisher: Addison-Wesley Pub (Sd); Pap/Dskt edition (June 1996)

Language: English

ISBN-10: 0201403536

ISBN-13: 978-0201403534

Product Dimensions: 0.5 x 6.2 x 9.2 inches

Shipping Weight: 10.4 ounces

Average Customer Review: 3.6 out of 5 stars [See all reviews](#) (7 customer reviews)

Best Sellers Rank: #1,731,302 in Books (See Top 100 in Books) #106 in [Books > Computers & Technology > Programming > Languages & Tools > Compiler Design](#) #313 in [Books > Computers & Technology > Programming > Languages & Tools > Compilers](#) #30532 in [Books > Science & Math > Mathematics](#)

Customer Reviews

For each of his major languages (Pascal, Modula, Oberon), Wirth wrote a new edition of his Compiler Construction book. In this book, he introduces to Compiler Construction in general and explains a particular implementation of a compiler for a small language (Oberon0). The current edition has been extended in some ways (the target RISC architecture is explained much better

now). I have read all three books on Compiler Construction by Wirth (even typed in the source of the first book on PL0) and many others by him. I still like his books although his style is a bit formal. Fortunately, the implementation issues keep him down to earth. This book is still the most demanding he wrote. Except for computer science students, which may be happy to get a worked out example in less than 200 pages.

I enjoyed reading this book. I have read several books on the topic and this is one of my favourite introduction. Obviously it is not as comprehensive as "Compilers Principles, Techniques and Tools" but in 180 pages, you'll learn the basics of compiler constructions. The book uses Oberon as the sample language. I had no problem with the choice because Oberon is close to other popular languages, starting with Pascal. And yet I confess I never wrote a single line of Oberon code...

Professor Wirth made an interesting introduction course in Compiler construction. He follows the same kind descriptive style he used on his legendary book "Algorithms + Data Structures = Programs" developing a PL/O virtual machine, P-code, and compiler. This time he do the same, but now using a RISC ideal machine similar (on its programming model) to Patterson & Hennessy DLX processor (Computer Architecture: A Quantitative Approach, A Computer Architecture: A Quantitative Approach). The RISC machine is beautiful and basic. An OBERON program module implementing an Interpreter for this RISC machine is included. The book cover basic topics like: BNF, a reference to N. Chomsky formal description of languages, and compiler architecture (front-end, back-end). OBERON programming language is similar to Pascal. I recommend very much to expose you to basic programming environments like this, as a complement to your normal work with new development technologies like .NET framework and Java framework. Also, I recommend you the following self-instruction path: 1) A Computer Organization and Design, Revised Printing, Third Edition, Third Edition: The Hardware/Software Interface (The Morgan Kaufmann Series in Computer ... Series in Computer Architecture and Design) 2) A Compiler Construction (International Computer Science Series) 3) A The Art of Computer Programming, Volume 1, Fascicle 1: MMIX -- A RISC Computer for the New Millennium (Art of Computer Programming) Another good intro to computer organization and general assembly language programming is: A Structured Computer Organization (5th Edition)

The book is concise and is only 175 pages thick. It doesn't get heavy into theory, but just enough for you understand Wirth's implementation of a compiler for his programming

language called Oberon-0. One might assume this a beginner's book or for those that never study compiler design or theory, but it is not. Wirth's style of writing sometimes is hard to follow unless you have some understanding of compiler construction theory. He moves along at a quick pace. If you understand some basic compiler theory, this book will teach you HOW to implement a compiler, else set the book outside, pour gasoline on it and light a match.

This book has helped me with every stage of writing my compiler. The only downside is that since it was written in 1975, it came with a floppy disk!!! Which I have no way of reading the data off of without buying a drive online.

Dry, uninteresting introduction to compiler design. Written like a reference rather than a text, the book is about as exciting as watching grass grow. Do not try reading this without at least 8 hours of prior sleep. The author should collaborate with an American writer and make it easier to read. The author makes it a point to showcase all of his publications and work. He also assumes the reader has some innate knowledge of Oberon, Modula and Pascal - all very esoteric languages and of questionable relevance.

I took a graduate course that included building a table driver, recursive descent (parsing) compiler-compiler, very similar to the one covered here, in 1967-68 using a book by Peter Z Ingemann. This book isn't mentioned in the Bibl. but 4 of the author's previous works are... nuff said!
